Git - Life Cycle

In this chapter, we will discuss the life cycle of Git. In later chapters, we will cover the Git commands for each operation.

General workflow is as follows −

- You clone the Git repository as a working copy.

- You modify the working copy by adding/editing files.

- If necessary, you also update the working copy by taking other developer's changes.

- You review the changes before commit.

- You commit changes. If everything is fine, then you push the changes to the repository.

- After committing, if you realize something is wrong, then you correct the last commit and push the changes to the repository.

Shown below is the pictorial representation of the work-flow.
